

MT5 Custom EA - Donchian Channel Strategy

DEVELOPER SPECIFICATION

1. Core Strategy

The EA monitors the Donchian Channel independently on 4 selectable timeframes. Default timeframes: M5, M15, M30, H1. Default Donchian Period: 50. The chart timeframe where the EA is attached must not change how the selected timeframes are monitored.

Signal	Same Direction	Inverse Direction
Upper Channel	BUY	SELL
Lower Channel	SELL	BUY

2. Strict Live Simultaneous Touch Confirmation

- Confirm_Directions must be adjustable from 1 to 4: 1 = 1 of 4 timeframes, 2 = 2 of 4, 3 = 3 of 4, 4 = all 4.
- The EA must evaluate the selected timeframes on every live tick.
- A timeframe counts as confirmed only while the CURRENT live price is at, reaching, or passing the applicable Donchian level for that timeframe at that moment.
- Touches must exist simultaneously. Previous touches must NOT be stored, remembered, accumulated, or carried forward after price is no longer satisfying that timeframe level.
- Example: with Confirm_Directions = 3, at least 3 of the 4 selected timeframes must be satisfying the applicable Donchian level on the same live tick before an entry is allowed.

Developer-critical rule: Do not implement a "touch memory" system. If one timeframe touched earlier and then moved away, that old touch cannot be combined with later touches from other timeframes.

3. Donchian Indicator / PLOT_SHIFT Behavior

The EA must match the supplied Donchian indicator behavior exactly. The channel calculation uses High/Low data and must reproduce the indicator's one-bar shifted behavior (PLOT_SHIFT = 1). The EA must use the same shifted Donchian level that the supplied indicator is displaying for each selected timeframe when evaluating a live touch. Do not substitute a generic or unshifted Donchian calculation if it produces different levels or signal timing.

4. EA Inputs - Core

Input	Setting / Purpose
Strategy_Mode	Same Direction / Inverse Direction
Confirm_Directions	1-4
Timeframe_1	Default M5
Timeframe_2	Default M15
Timeframe_3	Default M30
Timeframe_4	Default H1
Period_of_Channel	Default 50
Showprice_of_the_Level	True / False
LotSize	Adjustable

Input	Setting / Purpose
TP_Pips	Adjustable
SL_Pips	Adjustable
Magic_Number	Adjustable per chart/pair
Comment	Custom text

5. Basket Floating P/L - Simple Money Management

Basket Floating P/L = the combined current floating profit/loss of all open positions that belong to the same Basket_ID / EA Group ID, across all symbols and all EA instances.

- Every chart/pair may keep its own Magic_Number for individual trade identification and management.
- All copies of this EA that are intended to operate as one strategy basket use the same Basket_ID / EA Group ID.
- The user must NOT be required to manually type a list of Magic Numbers for the basket.
- The developer may internally tag/identify positions by Basket_ID (for example, by a persistent EA trade tag/comment or another reliable method), while preserving the user's individual Magic_Number settings.
- The Basket Floating P/L calculation must continuously include every open position belonging to that Basket_ID, regardless of symbol.

6. Max Basket Loss

Example: **Max_Basket_Loss_USD = 1000**. If the Basket Floating P/L reaches -\$1,000 or worse, the EA must immediately close ALL open positions belonging to that Basket_ID across every symbol. After the close event, that Basket_ID must be locked from opening new positions for the remainder of the trading day unless the user manually resets/unlocks it.

7. Max Basket Profit

Example: **Max_Basket_Profit_USD = 2000**. If the Basket Floating P/L reaches +\$2,000 or better, the EA must immediately close ALL open positions belonging to that Basket_ID across every symbol. After the close event, that Basket_ID must be locked from opening new positions for the remainder of the trading day unless the user manually resets/unlocks it.

8. Shared Basket Lock / Multi-Chart Coordination

- The basket close state and daily lock must be shared by ALL EA instances using the same Basket_ID.
- When one EA instance detects a basket threshold, it should set a shared "basket closing / locked" state before or while closing positions so other chart instances do not start duplicate close operations.
- While the Basket_ID is locked, every EA instance in that basket must block new Donchian entries even if a valid live simultaneous signal occurs.
- The lock applies to the whole Basket_ID, not only to the chart that detected the threshold.

9. Trading Day Definition

Trading day = 00:00:00 through 23:59:59 based on MT5 broker/server time. At the first tick after the broker/server date changes to a new day, the prior day's Basket_ID lock must automatically expire/reset and normal trading may resume.

10. Basket Money-Management Inputs

Input	Setting / Purpose
Enable_Basket_Floating_PL	True / False
Basket_ID	Common EA Group ID shared by all charts/pairs in the same basket
Max_Basket_Loss_USD	Dollar loss threshold; 0 = Disabled

Input	Setting / Purpose
Max_Basket_Profit_USD	Dollar profit threshold; 0 = Disabled
Lock_Trading_After_Target	True / False
Reset_Daily_Lock	Manual unlock/reset for the current trading day
